What You Learned Before

Evaluating Expressions

Example 1  Evaluate $6x + 2y$ when $x = -3$ and $y = 5$.

$6x + 2y = 6(-3) + 2(5)$
$= -18 + 10$
$= -8$

Substitute $-3$ for $x$ and $5$ for $y$. Using order of operations, multiply $6$ and $-3$, and $2$ and $5$. Add $-18$ and $10$.

Example 2  Evaluate $6x^2 - 3(y + 2) + 8$ when $x = -2$ and $y = 4$.

$6x^2 - 3(y + 2) + 8 = 6(-2)^2 - 3(4 + 2) + 8$
$= 6(-2)^2 - 3(6) + 8$
$= 6(4) - 3(6) + 8$
$= 24 - 18 + 8$
$= 14$

Try It Yourself

Evaluate the expression when $x = -\frac{1}{4}$ and $y = 3$.

1. $2xy$
2. $12x - 3y$
3. $-4x - y + 4$

3. **IN YOUR OWN WORDS** How can you simplify an algebraic expression? Give an example that demonstrates your procedure.

4. **REASONING** Why would you want to simplify an algebraic expression? Discuss several reasons.

**Practice** Use what you learned about simplifying algebraic expressions to complete Exercises 12–14 on page 84.
3.1 Lesson

Parts of an algebraic expression are called terms. Like terms are terms that have the same variables raised to the same exponents. Constant terms are also like terms. To identify terms and like terms in an expression, first write the expression as a sum of its terms.

EXAMPLE 1 Identifying Terms and Like Terms

Identify the terms and like terms in each expression.

a. \(9x - 2 + 7 - x\)
   Rewrite as a sum of terms.
   \(9x + (-2) + 7 + (-x)\)
   Terms: \(9x, -2, 7, -x\)

b. \(z^2 + 5z - 3z^2 + z\)
   Rewrite as a sum of terms.
   \(z^2 + 5z + (-3z^2) + z\)
   Terms: \(z^2, 5z, -3z^2, z\)

Like terms: \(9x\) and \(-x\), \(-2\) and \(7\)

Like terms: \(z^2\) and \(-3z^2\), \(5z\) and \(z\)

An algebraic expression is in simplest form when it has no like terms and no parentheses. To combine like terms that have variables, use the Distributive Property to add or subtract the coefficients.

EXAMPLE 2 Simplifying an Algebraic Expression

Simplify \(\frac{3}{4}y + 12 - \frac{1}{2}y - 6\).

\[
\frac{3}{4}y + 12 - \frac{1}{2}y - 6 = \frac{3}{4}y + 12 + \left( -\frac{1}{2}y \right) + (-6) \quad \text{Rewrite as a sum.}
\]

\[
= \frac{3}{4}y + \left( -\frac{1}{2}y \right) + 12 + (-6) \quad \text{Commutative Property of Addition}
\]

\[
= \left[ \frac{3}{4} + \left( -\frac{1}{2} \right) \right]y + 12 + (-6) \quad \text{Distributive Property}
\]

\[
= \frac{1}{4}y + 6 \quad \text{Combine like terms.}
\]

Study Tip
To subtract a variable term, add the term with the opposite coefficient.

On Your Own
Identify the terms and like terms in the expression.

1. \(y + 10 - \frac{3}{2}y\)
2. \(2r^2 + 7r - r^2 - 9\)
3. \(7 + 4p - 5 + p + 2q\)

Simplify the expression.

4. \(14 - 3z + 8 + z\)
5. \(2.5x + 4.3x - 5\)
6. \(\frac{3}{8}b - \frac{3}{4}b\)
EXAMPLE 3  Simplifying an Algebraic Expression

Simplify \(-\frac{1}{2}(6n + 4) + 2n\).

\[-\frac{1}{2}(6n + 4) + 2n = -\frac{1}{2}(6n) + \left(-\frac{1}{2}\right)(4) + 2n\]  Distributive Property

\[= -3n + (-2) + 2n\]  Multiply.

\[= -3n + 2n + (-2)\]  Commutative Property of Addition

\[= (-3 + 2)n + (-2)\]  Distributive Property

\[= -n - 2\]  Simplify.

On Your Own

9. \(7 - 4\left(\frac{3}{4}x - \frac{1}{4}\right)\)

EXAMPLE 4  Real-Life Application

Each person in a group buys a ticket, a medium drink, and a large popcorn. Write an expression in simplest form that represents the amount of money the group spends at the movies. Interpret the expression.

**Words**
- Each ticket is $7.50,

- and each large popcorn is $4.

**Variable**
- The same number of each item is purchased. So, \(x\) can represent the number of tickets, the number of medium drinks, and the number of large popcorns.

**Expression**

\[7.50x + 2.75x + 4x = (7.50 + 2.75 + 4)x\]  Distributive Property

\[= 14.25x\]  Add coefficients.

The expression \(14.25x\) indicates that the total cost per person is $14.25.

You can use a vertical or a horizontal method to add linear expressions.

### EXAMPLE 1 Adding Linear Expressions

Find each sum.

**a.** $(x - 2) + (3x + 8)$

**Vertical method:** Align like terms vertically and add.

\[
\begin{align*}
(x - 2) & \quad + \\

4x + 6 & 
\end{align*}
\]

**b.** $(-4y + 3) + (11y - 5)$

**Horizontal method:** Use properties of operations to group like terms and simplify.

\[
(-4y + 3) + (11y - 5) = -4y + 3 + 11y - 5 \quad \text{Rewrite the sum.}
\]

\[
= -4y + 11y + 3 - 5 \quad \text{Commutative Property of Addition}
\]

\[

\]

\[

\]

### EXAMPLE 2 Adding Linear Expressions

\[
2(-7.5z + 3) + (5z - 2) = -15z + 6 + 5z - 2 \quad \text{Distributive Property}
\]

\[

\[
\begin{align*}
(5x + 6) - (-x + 6) &= 5x + 6 + x - 6 \\
&= 6x
\end{align*}
\]

**b. Horizontal method:** Use properties of operations to group like terms and simplify.

\[
\begin{align*}
(7y + 5) - 2(4y - 3) &= 7y + 5 - 8y + 6 \\
&= 7y - 8y + 5 + 6 \\
&= (7y - 8y) + (5 + 6) \\
&= -y + 11

32. \(x + y\)

33. \(2x + 6y\)

34. \(-x + 4y\)

35. **MULTIPLE CHOICE** What is the surface area of a cube that has a side length of 5 feet? *(Skills Review Handbook)*

A) 25 ft\(^2\)  
B) 75 ft\(^2\)  
C) 125 ft\(^2\)  
D) 150 ft\(^2\)
When **factoring an expression**, you write the expression as a product of factors. You can use the Distributive Property to factor expressions.

**EXAMPLE 1**  
**Factoring Out the GCF**

Factor $24x - 18$ using the GCF.

Find the GCF of $24x$ and $18$ by writing their prime factorizations.

$24x = 2 \cdot 2 \cdot 2 \cdot 3 \cdot x$  
$18 = 2 \cdot 3 \cdot 3$  

Circle the common prime factors.

So, the GCF of $24x$ and $18$ is $2 \cdot 3 = 6$. Use the GCF to factor the expression.

$24x - 18 = 6(4x) - 6(3)$  
$= 6(4x - 3)$  

Distributive Property

So, $24x - 18 = 6(4x - 3)$.

You can also use the Distributive Property to factor out any rational number from an expression.

**EXAMPLE 2**  
**Factoring Out a Fraction**

Factor $\frac{1}{2}$ out of $\frac{1}{2}x + \frac{3}{2}$.

Write each term as a product of $\frac{1}{2}$ and another factor.

$\frac{1}{2}x = \frac{1}{2} \cdot x$  
$\frac{3}{2} = \frac{1}{2} \cdot 3$  

$\frac{1}{2}x$ is $\frac{1}{2}$ times what?  
$\frac{3}{2}$ is $\frac{1}{2}$ times what?

Use the Distributive Property to factor out $\frac{1}{2}$.

$\frac{1}{2}x + \frac{3}{2} = \frac{1}{2} \cdot x + \frac{1}{2} \cdot 3$  
$= \frac{1}{2}(x + 3)$  

Distributive Property

So, $\frac{1}{2}x + \frac{3}{2} = \frac{1}{2}(x + 3)$.  

Linear Expressions  
In this extension, you will  
• factor linear expressions.
EXAMPLE 3  Factoring Out a Negative Number

Factor \(-2\) out of \(-4p + 10\).

Write each term as a product of \(-2\) and another factor.

\[-4p = -2 \cdot 2p\]  
Think: \(-4p\) is \(-2\) times what?

\[10 = -2 \cdot (-5)\]  
Think: \(10\) is \(-2\) times what?

Use the Distributive Property to factor out \(-2\).

\[-4p + 10 = -2 \cdot 2p + (-2) \cdot (-5)\]  
Rewrite the expression.

\[= -2[2p + (-5)]\]  
Distributive Property

\[= -2(2p - 5)\]  
Simplify.

\[\therefore -4p + 10 = -2(2p - 5).\]

1. \(9 + 21\)

3.5 Solving Two-Step Equations

Essential Question How can you use algebra tiles to solve a two-step equation?

ACTIVITY: Solving a Two-Step Equation

Work with a partner. Use algebra tiles to model and solve $2x - 3 = -5$.  

Model the equation $2x - 3 = -5$.  

Remove the red tiles on the left side by adding yellow tiles to each side.  

How many zero pairs can you remove from each side?  

Circle them.  

Because there are green tiles, divide the red tiles into equal groups. Circle the groups.  

Keep one of the groups. This shows the value of $x$.  

So, $x = \_ \_$.  

ACTIVITY: The Math behind the Tiles

Work with a partner. Solve $2x - 3 = -5$ without using algebra tiles. Complete each step. Then answer the questions.  

Use the steps in Activity 1 as a guide.

2x - 3 = -5  

Write the equation.  

2x - 3 + ___ = -5 + ___  

Add ___ to each side.  

2x = ___  

Simplify.  

___ = ___  

Divide each side by ___.  

___ = ___  

Simplify.  

So, $x = \_ \_$.  

a. Which step is first, adding 3 to each side or dividing each side by 2?  

b. How are the above steps related to the steps in Activity 1?

108 Chapter 3 Expressions and Equations
3 **ACTIVITY: Solving Equations Using Algebra Tiles**

- Use algebra tiles to model and solve the equation.
- Check your answer by solving the equation without using algebra tiles.

4 **ACTIVITY: Working Backwards**

Work with a partner.

- **Sample:** Your friend pauses a video game to get a drink. You continue the game. You double the score by saving a princess. Then you lose 75 points because you do not collect the treasure. You finish the game with \(-25\) points. How many points did you have when you started?

  One way to solve the problem is to work backwards. To do this, start with the end result and retrace the events.

  - You have \(-25\) points at the end of the game.
  - You lost 75 points for not collecting the treasure, so add 75 to \(-25\).
  - You doubled your score for saving the princess, so find half of 50.

  So, you started the game with 25 points.

- **b.** You triple your account balance by making a deposit. Then you withdraw $127.32 to buy groceries. Your account is now overdrawn by $10.56. By working backwards, find your account balance before you made the deposit.

-\frac{3}{4} = \frac{1}{4} \cdot (-3)
\]

Use the Distributive Property to factor out \(\frac{1}{4}\).

120  Chapter 3  Expressions and Equations
9. Jacob was evaluating the expression below when $x = -2$ and $y = 4$.

$$3 + x^2 + y$$

His work is in the box below.

$$3 + x^2 + y = 3 + (-2)^2 + 4$$
$$= 3 - 4 + 4$$
$$= 3 - 1$$
$$= 3$$

What should Jacob do to correct the error that he made?
A. Divide 3 by 4 before subtracting.
B. Square $-2$, then divide.
C. Square then divide.
D. Subtract 4 from 3 before dividing.

10. Which number is equivalent to the expression shown below?

$$-2\frac{1}{4} - \left(-\frac{3\frac{1}{3}}{8}\right)$$

F. $-10\frac{5}{8}$

G. $-10\frac{1}{3}$

H. $6\frac{1}{8}$

I. $6\frac{1}{2}$

11. You want to buy the bicycle. You already have $43.50 saved and plan to save an additional $7.25 every week.

**Part A** Write and solve an equation to find the number of weeks you need to save before you can purchase the bicycle.

**Part B** How much sooner could you purchase the bicycle if you had a coupon for $20 off and saved $8.75 every week? Explain your reasoning.
