Zeros, Factors, Solutions, and Intercepts

Let \( f(x) = a_nx^n + a_{n-1}x^{n-1} + \cdots + a_1x + a_0 \) be a polynomial function. The following statements are equivalent.

**Zero:** \( k \) is a zero of the polynomial function \( f \).

**Factor:** \( x - k \) is a factor of the polynomial \( f(x) \).

**Solution:** \( k \) is a solution (or root) of the polynomial equation \( f(x) = 0 \).

**x-Intercept:** If \( k \) is a real number, then \( k \) is an \( x \)-intercept of the graph of the polynomial function \( f \). The graph of \( f \) passes through \( (k, 0) \).

4.8 Notetaking with Vocabulary (continued)

The Location Principle

If $f$ is a polynomial function, and $a$ and $b$ are two real numbers such that $f(a) < 0$ and $f(b) > 0$, then $f$ has at least one real zero between $a$ and $b$.

Notes:

Turning Points of Polynomial Functions

1. The graph of every polynomial function of degree $n$ has at most $n - 1$ turning points.

2. If a polynomial function has $n$ distinct real zeros, then its graph has exactly $n - 1$ turning points.

Notes:
Even and Odd Functions

A function \( f \) is an **even function** when \( f(-x) = f(x) \) for all \( x \) in its domain. The graph of an even function is **symmetric about the y-axis**.

A function \( f \) is an **odd function** when \( f(-x) = -f(x) \) for all \( x \) in its domain. The graph of an odd function is **symmetric about the origin**. One way to recognize a graph that is symmetric about the origin is that it looks the same after a 180° rotation about the origin.

**Even Function**

\[
(x, y) \quad \text{and} \quad (-x, y)
\]

For an even function, if \((x, y)\) is on the graph, then \((-x, y)\) is also on the graph.

**Odd Function**

\[
(x, y) \quad \text{and} \quad (-x, -y)
\]

For an odd function, if \((x, y)\) is on the graph, then \((-x, -y)\) is also on the graph.

Notes:
In Exercises 1–6, graph the function. Identify the $x$-intercepts, and the points where the local maximums and local minimums occur. Determine the intervals for which the function is increasing or decreasing. Determine whether the function is even, odd, or neither.

1. $f(x) = 4x^3 - 12x^2 - x + 15$

2. $g(x) = 2x^4 + 5x^3 - 21x^2 - 10x$

3. $h(x) = x^3 - x^2 - 13x - 3$

4. $k(x) = x^3 - 2x$

5. $f(x) = x^4 - 29x^2 + 100$

6. $g(x) = -\frac{1}{3}x^3 + x^2 - \frac{4}{3}$
4.9 Modeling with Polynomial Functions
For use with Exploration 4.9

Essential Question: How can you find a polynomial model for real-life data?

1 EXPLORATION: Modeling Real-Life Data

Go to BigIdeasMath.com for an interactive tool to investigate this exploration.

Work with a partner. The distance a baseball travels after it is hit depends on the angle at which it was hit and the initial speed. The table shows the distances a baseball hit at an angle of 35° travels at various initial speeds.

<table>
<thead>
<tr>
<th>Initial speed, ( x ) (miles per hour)</th>
<th>80</th>
<th>85</th>
<th>90</th>
<th>95</th>
<th>100</th>
<th>105</th>

<th>115</th>

</thead>
<tbody>

<td>Distance, ( y ) (feet)</td>
<td>194</td>

<td>247</td>
<td>275</td>
<td>304</td>
<td>334</td>
<td>365</td>
<td>397</td>
</tr>
</tbody>
</table>

a. Recall that when data have equally-spaced \( x \)-values, you can analyze patterns in the differences of the \( y \)-values to determine what type of function can be used to model the data. If the first differences are constant, then the set of data fits a linear model. If the second differences are constant, then the set of data fits a quadratic model.

Find the first and second differences of the data. Are the data linear or quadratic? Explain your reasoning.

b. Use a graphing calculator to draw a scatter plot of the data. Do the data appear linear or quadratic? Use the regression feature of the graphing calculator to find a linear or quadratic model that best fits the data.
c. Use the model you found in part (b) to find the distance a baseball travels when it is hit at an angle of $35^\circ$ and travels at an initial speed of 120 miles per hour.

d. According to the *Baseball Almanac*, “Any drive over 400 feet is noteworthy. A blow of 450 feet shows exceptional power, as the majority of major league players are unable to hit a ball that far. Anything in the 500-foot range is genuinely historic.” Estimate the initial speed of a baseball that travels a distance of 500 feet.

**Communicate Your Answer**

2. How can you find a polynomial model for real-life data?

3. How well does the model you found in Exploration 1(b) fit the data? Do you think the model is valid for any initial speed? Explain your reasoning.

Core Concepts

Properties of Finite Differences

1. If a polynomial function \( f(x) \) has degree \( n \), then the \( n \)th differences of function values for equally-spaced \( x \)-values are nonzero and constant.

2. Conversely, if the \( n \)th differences of equally-spaced data are nonzero and constant, then the data can be represented by a polynomial function of degree \( n \).
